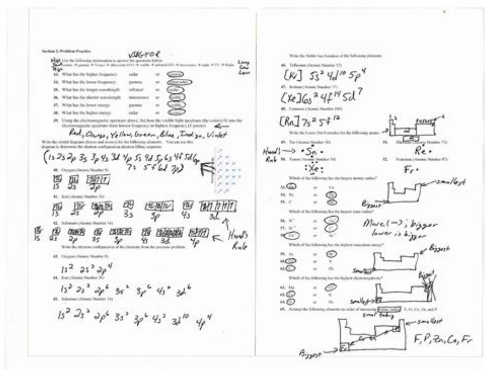
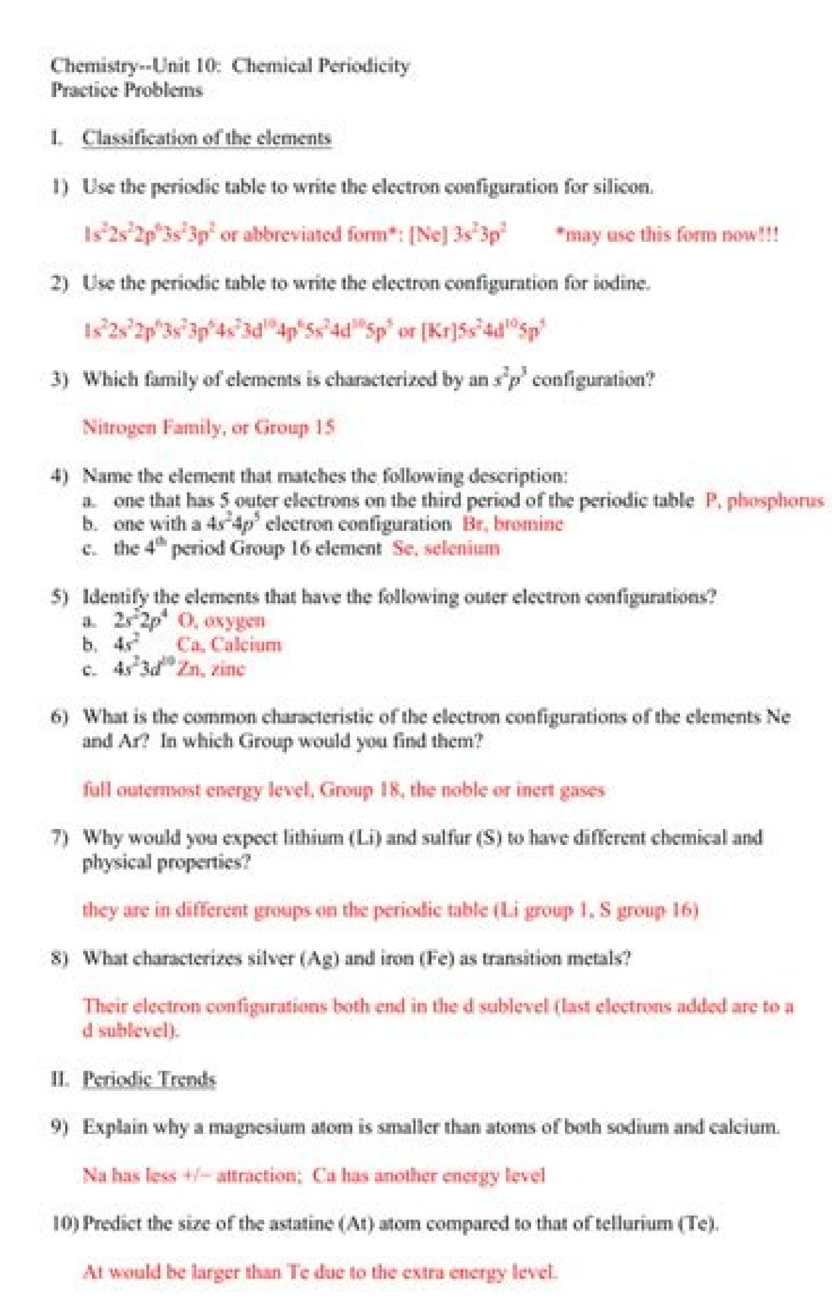
Electron configuration and octet rule worksheet answers answer keys free





Chemistry--Unit 10: Chemical Periodicity
Practice Problems

I. Classification of the elements

1) Use the periodic table to write the electron configuration for silicon.

$1s^2 2s^2 2p^6 3s^2 3p^2$ or abbreviated form*: [Ne] $3s^2 3p^2$ *may use this form now!!!

2) Use the periodic table to write the electron configuration for iodine.

$1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6 5s^2 4d^{10} 5p^5$ or [Kr]$5s^2 4d^{10} 5p^5$

3) Which family of elements is characterized by an s^2p^3 configuration?

Nitrogen Family, or Group 15

4) Name the element that matches the following description:
a. one that has 5 outer electrons on the third period of the periodic table P, phosphorus
b. one with a $4s^2 4p^5$ electron configuration Br, bromine
c. the 4th period Group 16 element Se, selenium

5) Identify the elements that have the following outer electron configurations?
a. $2s^2 2p^4$ O, oxygen
b. $4s^2$ Ca, Calcium
c. $4s^2 3d^{10}$ Zn, zinc

6) What is the common characteristic of the electron configurations of the elements Ne and Ar? In which Group would you find them?

full outermost energy level, Group 18, the noble or inert gases

7) Why would you expect lithium (Li) and sulfur (S) to have different chemical and physical properties?

they are in different groups on the periodic table (Li group 1, S group 16)

8) What characterizes silver (Ag) and iron (Fe) as transition metals?

Their electron configurations both end in the d sublevel (last electrons added are to a d sublevel).

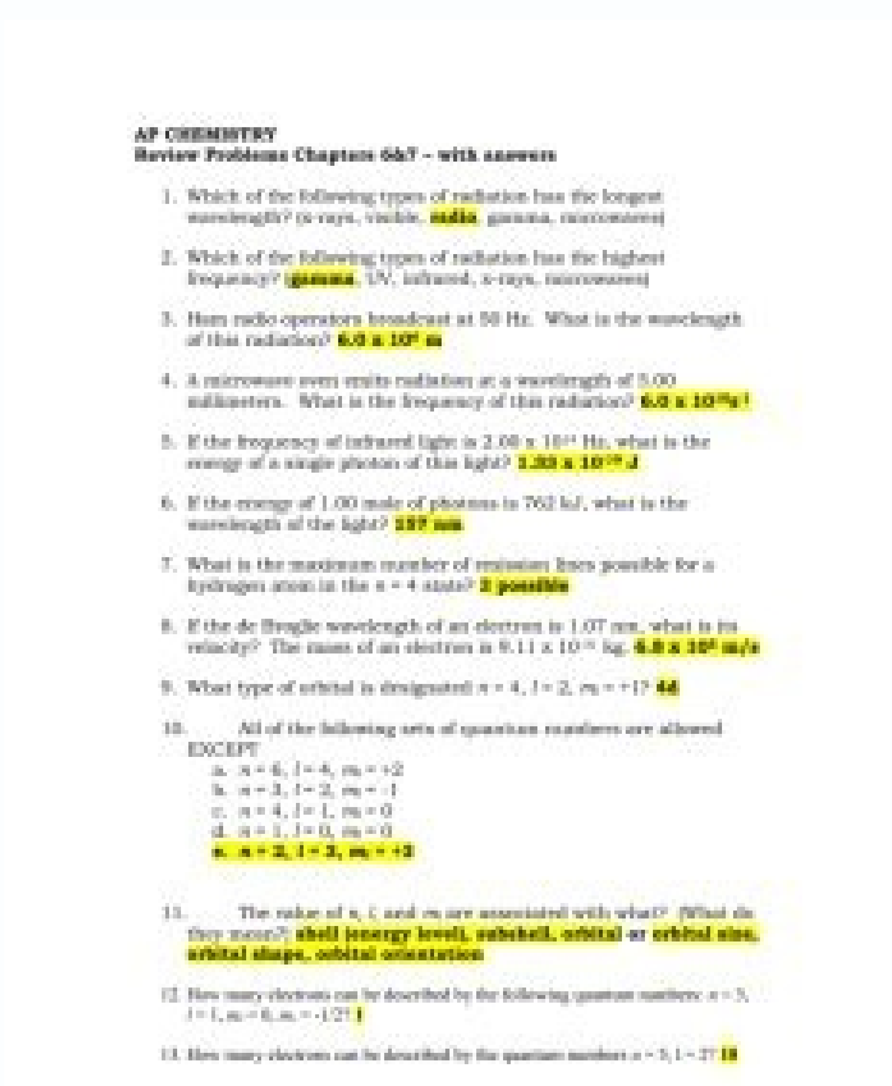
II. Periodic Trends

9) Explain why a magnesium atom is smaller than atoms of both sodium and calcium.

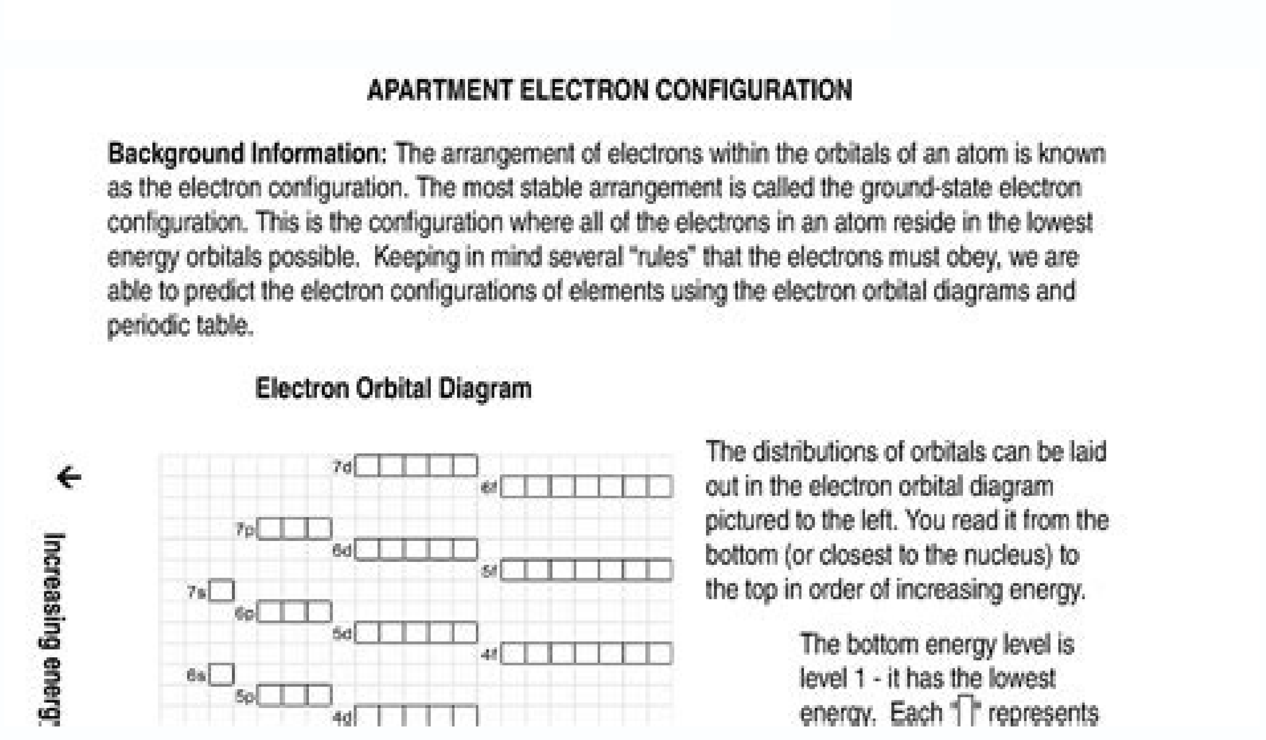
Na has less +/- attraction; Ca has another energy level

10) Predict the size of the astatine (At) atom compared to that of tellurium (Te).

At would be larger than Te due to the extra energy level.



AP CHEMISTRY
Review Problems Chapters 6&7 – with answers



APARTMENT ELECTRON CONFIGURATION

Background Information: The arrangement of electrons within the orbitals of an atom is known as the electron configuration. The most stable arrangement is called the ground-state electron configuration. This is the configuration where all of the electrons in an atom reside in the lowest energy orbitals possible. Keeping in mind several "rules" that the electrons must obey, we are able to predict the electron configurations of elements using the electron orbital diagrams and periodic table.

Electron Orbital Diagram

The distributions of orbitals can be laid out in the electron orbital diagram pictured to the left. You read it from the bottom (or closest to the nucleus) to the top in order of increasing energy.

The bottom energy level is level 1 - it has the lowest energy. Each ↑ represents
